For example, I would like to calculate the distance from (x,y) to (0,0) in matplotlib. import matplotlib.pyplot as plt import math x=1 y=10 x2=0 y2=0 a=(x-x2)**2 b=(y-y2)**2 c=math.sqrt(a+b) print(c) I've got an error: Traceback (most recent call last): File "calculate.py", line 8, in c=math.sqrt(a+b) TypeError: unsupported operand type(s) for +: 'NoneType' and 'NoneType' A: a and b are None. You need to initialize them first: a=0 b=0 print(math.sqrt(a+b)) Empirical pharmacokinetic modeling of propofol and its major metabolite, propofol glucuronide. We have developed a model of the kinetics of the non-protein-bound parent drug and its major metabolite, propofol glucuronide (PG), using the data of 50 subjects randomized into three age groups (20-40, 41-60, and 61-80 years). The study was approved by the local ethics committee. Randomized subjects had an intravenous propofol bolus of 4 mg kg(-1) given over 90 s followed by a continuous infusion of 0.5, 1.0, and 1.5 mg kg(-1) h(-1). After equilibration for 10 min, blood samples were collected at 5 min intervals for up to 2 h. The time-concentration data were analyzed by using a non-linear mixed effects model (NONMEM) to determine the pharmacokinetic parameters of the plasma concentration-time profiles for the parent and metabolite. In each group, different compartments were included in the model. The concentrations in the central and peripheral compartment were best described by a linear and a first order absorption model, respectively. The volume of distribution and first order formation
